Madoko Presentation

Using [Madoko](#) it is easy to create beautiful presentations.

- [Html](#): Uses the `Reveal.js` library by [Hakim El Hattab](#).
This slide demo in Madoko is an adaption of his online demo.
- [Pdf](#): Uses the Beamer package for LaTeX
- [Source](#): Click to see the source of this presentation.

Reveal.js

reveal.js is a framework for easily creating beautiful presentations using HTML. You'll need a browser with support for CSS 3D transforms to see it in its full glory.

And any Madoko features just work. Here is some math:

A famous equation is $e = mc^2$, but this one is famous too:

$$\int_{-\infty}^{\infty} e^{-ax^2} dx = \sqrt{\frac{\pi}{a}} \quad (1)$$

Code

Here is code, highlighted by Madoko

```
function sqr( x ) {  
    var  $\pi$  = 3.141593;  
    return x*x;  /* the square */  
}
```

We used `\(` and `\)` to escape into markdown to write π .

Vertical Slides

Slides can be nested inside of other slides, try pressing down.

Basement Level 1

Press down or up to navigate.

Basement Level 2

Use columns to put blocks next to each other:

A monarch butterfly (as shown in Figure 1) spends the winter in Mexico.

Figure 1. A monarch

Basement Level 3

That's it, time to go back up.

Themes

Reveal.js comes with a few themes built in:

- Default
- Sky
- Beige
- Serif
- Simple
- Night
- Moon
- Solarized

Theme demos are loaded after the presentation which leads to flicker. In production you should load your theme in the `<head>` using a `<link>`.

Transitions

You can select from different transitions, like:

Cube - Page - Concave - Zoom - Linear - Fade - None - Default

Pauses?

Some pauses.

- Test 2
- Test 3

Cool!.

A slide with no header

Point of View

In Reveal.js Press **ESC** to enter the slide overview.
Hold down alt and click on any element to zoom in on it using [zoom.js](#). Alt + click anywhere to zoom back out.

Works in Mobile Safari

Try it out! You can swipe through the slides and pinch your way to the overview.

Printing

You can print a revealjs presentation nicely from the browser. First give the `?print-pdf` or `?print-paper` query on your final presentation (in the browser address bar) and then print from the Chrome browser selecting Save to PDF.

Read more about it at the [revealjs documentation](#)

RevealJS library

Normally, the `revealjs` library is loaded from a CDN but you can specify your own url using metadata:

Reveal Url: `<my url>`

This can be useful when using a [server to run revealjs](#) where you may use something like:

`@noproview Reveal Url: http://localhost:8000/reveal.js`

Thanks for looking :-)
